

PyCharm — Step-by-step tutorial

Quick friendly walk-through so you can open PyCharm, create a project, run and debug code. We'll use the **Community** edition in this module.

Before you start

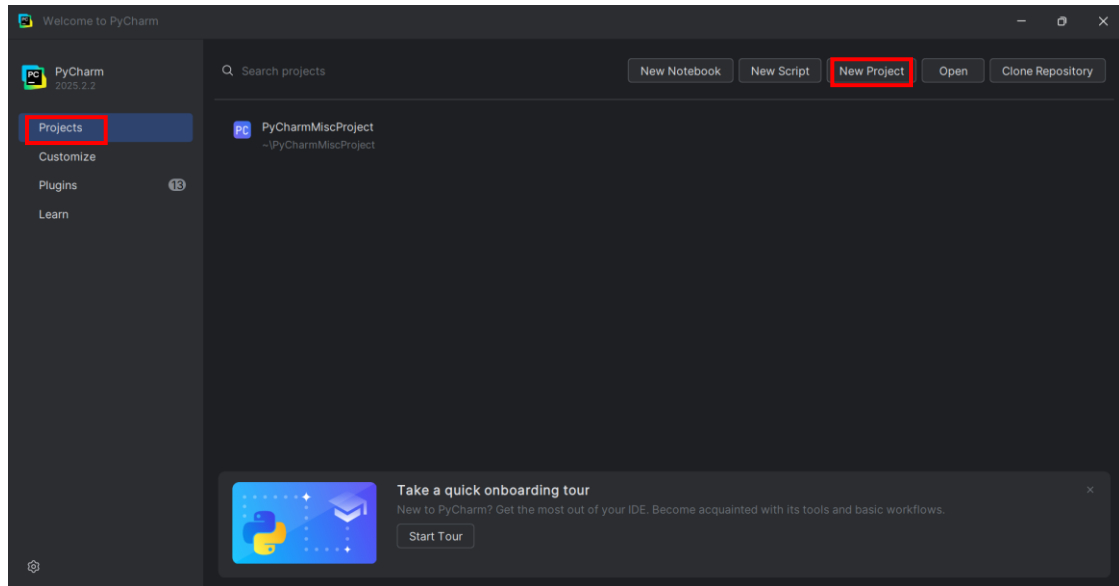

- Install Python from python.org (3.8+ recommended).
- Download & install **PyCharm** from JetBrains (Community ~~or Professional~~). Ignore the Professional version by just clicking continue without activate the professional version.
- You can refer to the **PyCharm** installation guide available on MOODLE.

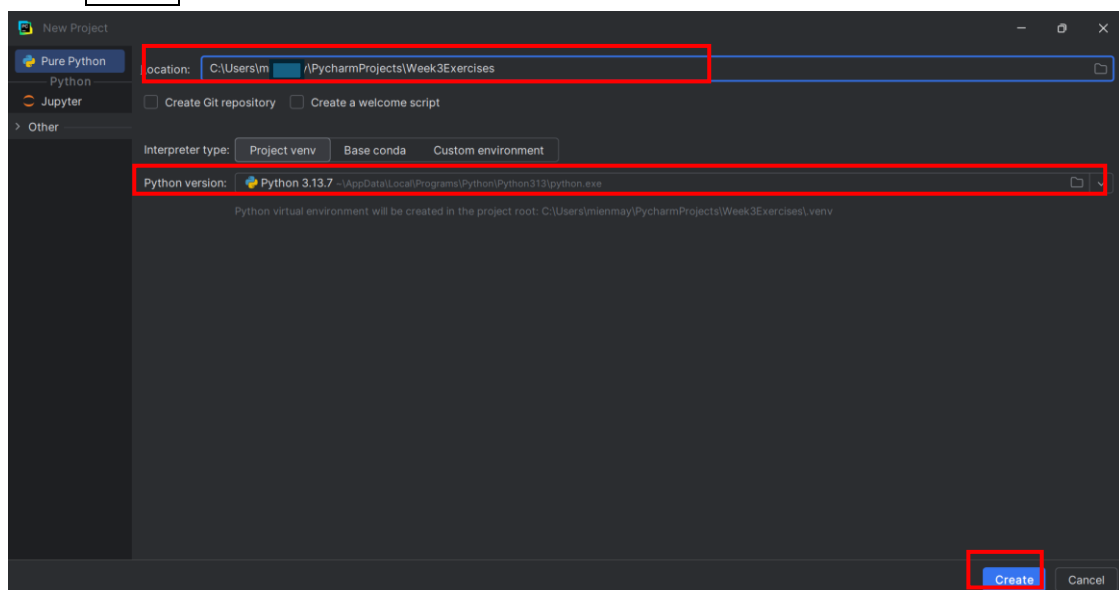

- Open PyCharm.

A. Create a new project

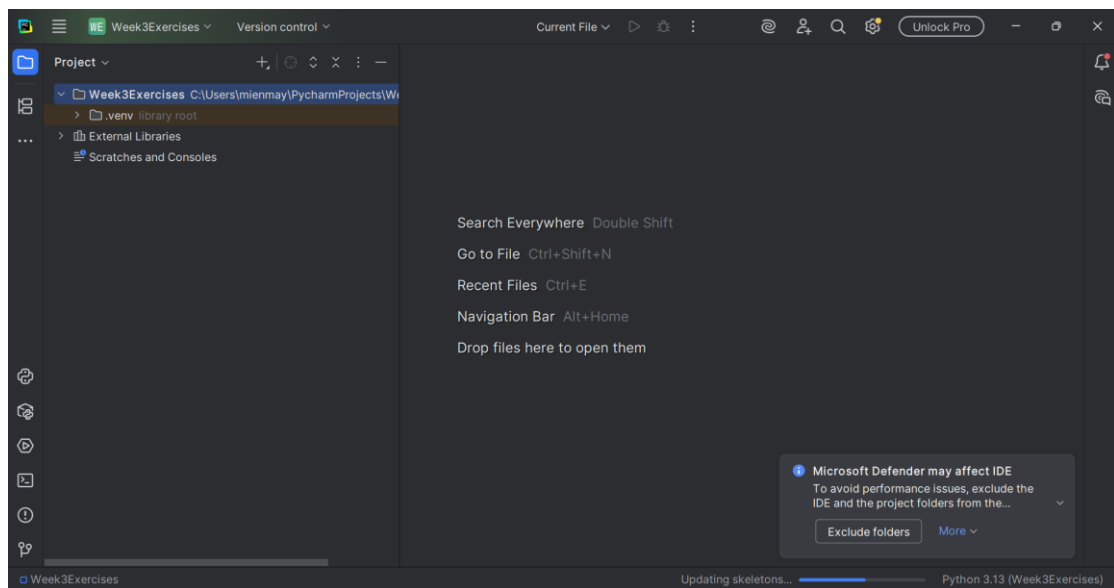

1. Open PyCharm → **New Project**.

2. Give it a name: **Week 3 Exercises** and a location to store the project.
3. Choose one of the **Python Interpreter**.
4. Click **Create**.

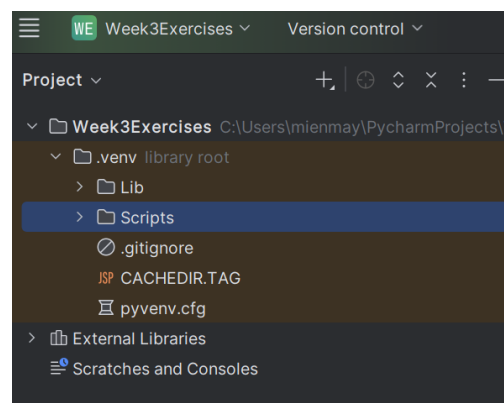

5. PyCharm creates project folders.

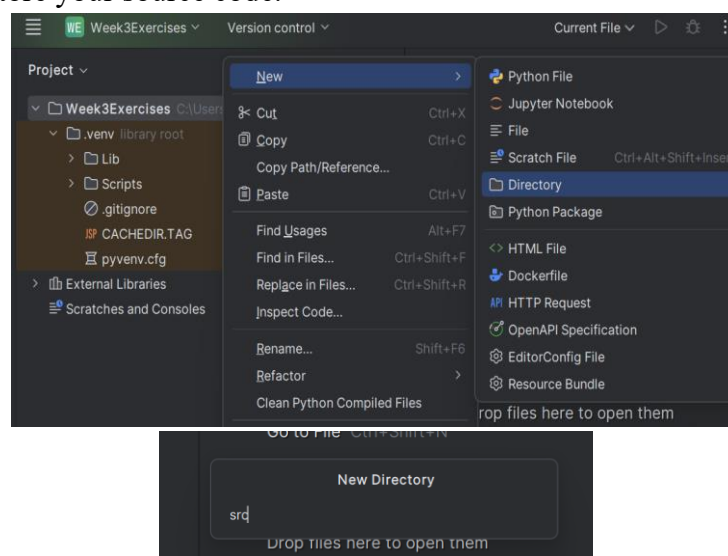

B. Project layout & where to put files

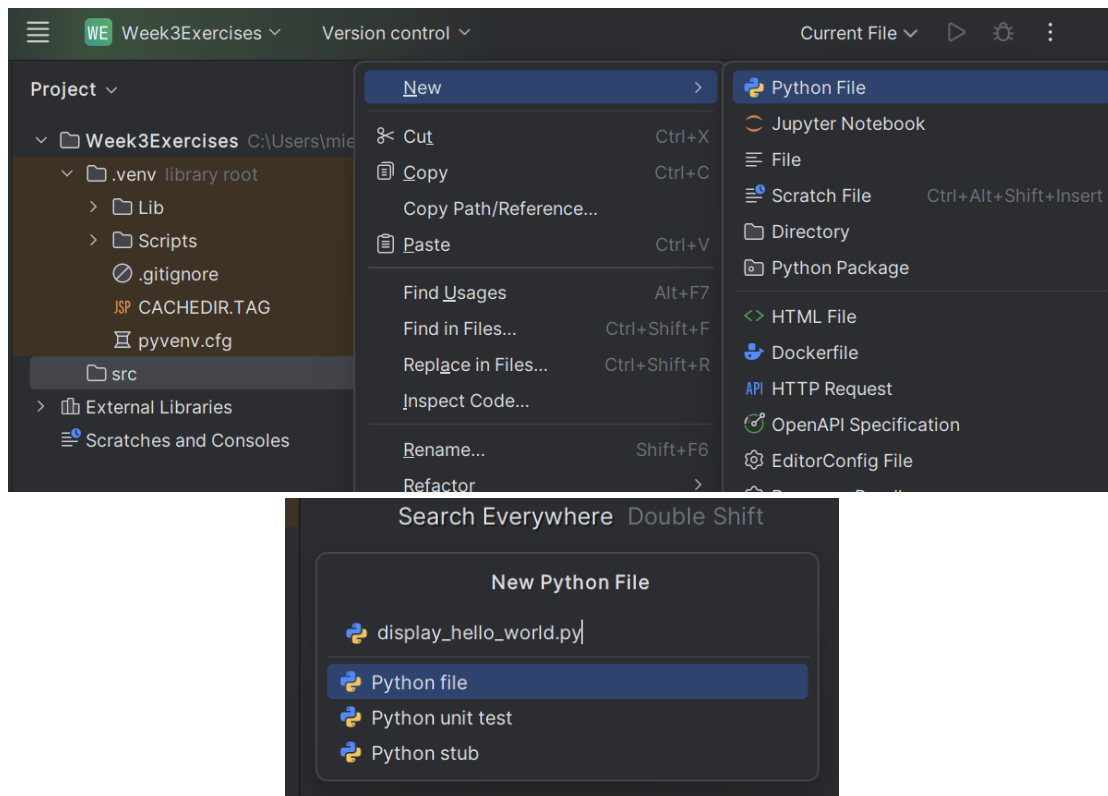

1. Typical structure:

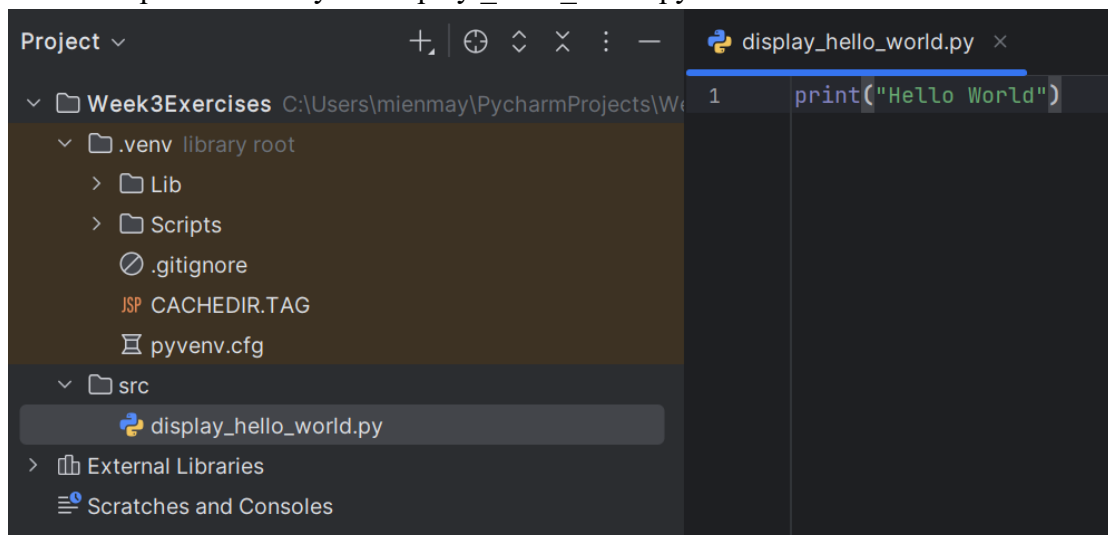

2. In PyCharm: Right-click on the project name → **New** → **Directory** to create your Directory to store your source code.

- Right-click on the `src` directory name → **New** → **Python File** to create your first python code. Give the python code name as: `display_hello_world.py`.

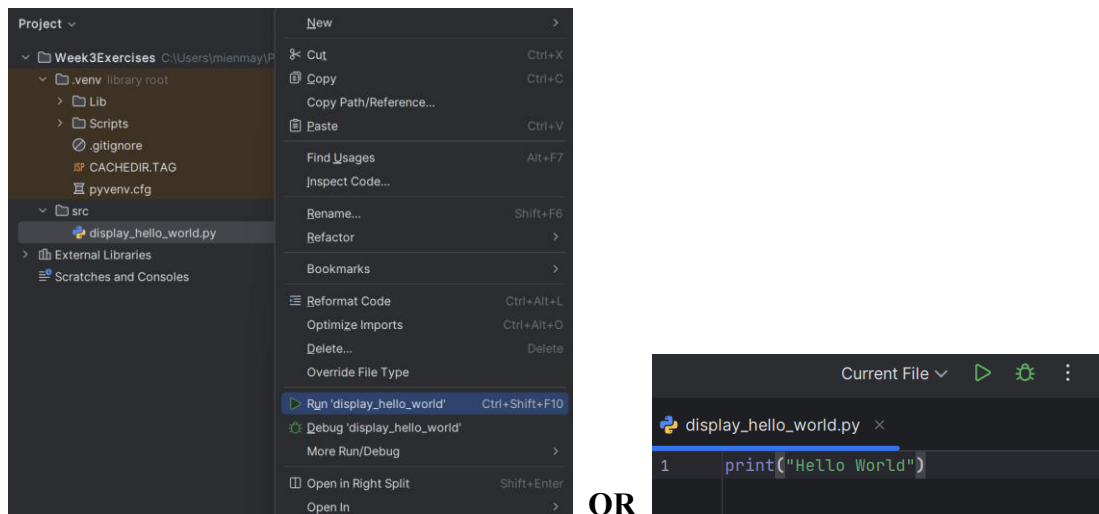

- Add example code into your `display_hello_world.py`.

5. Now, run your code.

- Right-click `main.py` → **Run 'main'** OR
- Click the green ▶ in the top-right after creating a Run Configuration.

6. Finally, if you see this message in your console, it means the code has run successfully.
